

Blockchain technology is a decentralized digital ledger that records transactions across a network of computers. It is designed to be secure, transparent, and resistant to fraud. The most well-known application of blockchain is Bitcoin, but it has many other uses, including smart contracts, supply chain management, and digital identity.

Blockchain is a distributed ledger technology (DLT) that allows for secure, transparent, and tamper-proof transactions. It is based on a network of nodes that maintain a copy of the ledger. The most popular blockchain is Bitcoin, but there are many others, including Ethereum, Litecoin, and Ripple. Blockchain is used in a variety of applications, including finance, supply chain, and digital identity.
