

DE OILED RICE BRAN (DORB) PROJECT

The project is aimed at providing a sustainable and nutritious feed supplement for dairy cattle. The DORB is produced from rice bran, which is a by-product of rice milling. It is rich in fiber and contains essential nutrients for the health and productivity of the animals.

The DORB is produced through a process of de-oiling, which removes the excess oil content. This process ensures that the feed is stable and has a long shelf life. The resulting DORB is a high-quality feed supplement that can be used in various feeding regimes.

The DORB is a cost-effective feed supplement that can be produced locally. It is a natural and safe feed that does not contain any synthetic additives. The use of DORB in feed supplements can help reduce the environmental impact of feed production and improve the overall sustainability of the dairy industry.

The DORB is a feed supplement that is rich in fiber and contains essential nutrients for the health and productivity of the animals. It is a natural and safe feed that does not contain any synthetic additives. The use of DORB in feed supplements can help reduce the environmental impact of feed production and improve the overall sustainability of the dairy industry.
