Figure 1. The overall research design. The figure illustrates a flowchart of the study design. It starts with 'Study Design' leading to 'Study Population'. From 'Study Population', the flow splits into 'Intervention Group' and 'Control Group'. Both groups undergo 'Baseline Assessment'. The 'Intervention Group' then receives 'Intervention', while the 'Control Group' receives 'Control'. Both groups undergo 'Post-Intervention Assessment' and 'Follow-up Assessment'. The flowchart concludes with 'Data Analysis' and 'Reporting Results'.

Study Design                      Intervention Group                      Control Group

Study Population                      Intervention Group                      Control Group

Baseline Assessment                      Post-Intervention Assessment                      Follow-up Assessment

The study design is a parallel, randomized controlled trial. The study population consists of adults aged 18 and over. The intervention group receives the intervention, and the control group receives the control. Baseline assessments are conducted before the intervention, and post-intervention and follow-up assessments are conducted after the intervention. Data analysis and reporting of results are the final steps of the study.

The study aims to evaluate the effectiveness of the intervention compared to the control. The primary outcome is the change in the outcome variable over time. Secondary outcomes include adherence to the intervention and control, and the occurrence of adverse events. The study is powered to detect a statistically significant difference between the intervention and control groups. The results of the study will be reported in a peer-reviewed journal.

This study was approved by the ethics committee, and all participants provided informed consent. The study is registered with the ClinicalTrials.gov (NCT00000000) and is available for public viewing.
