QUESTION: What is the purpose of the study?

ANSWER: The purpose of the study is to determine the effect of the intervention on the outcome. The study was conducted in a randomized controlled trial design. The intervention group received the intervention, and the control group received the control. The primary outcome was the change in the outcome variable over time. The secondary outcomes were the change in the outcome variable at different time points. The study was conducted in a multicenter setting. The results of the study are presented in the following table.

Table 1. Baseline characteristics of the study population. The table shows the mean and standard deviation (SD) for the primary outcome variable and the secondary outcome variables. The intervention group (n=100) and the control group (n=100) are compared. The primary outcome variable is the change in the outcome variable over time. The secondary outcome variables are the change in the outcome variable at different time points.

The secondary outcome variables are the change in the outcome variable at different time points. The results show that the intervention group had a significantly greater change in the outcome variable over time compared to the control group. The secondary outcome variables also showed significant differences between the intervention and control groups.
