Из-за этого вспомогательный генератор не может выдавать ток, и в результате машина останавливается. Важно отметить, что вспомогательный генератор не имеет собственного регулятора напряжения, поэтому его ток регулируется с помощью реостата, который включается в цепь якоря. При этом реостат не только регулирует ток якоря, но и снижает напряжение на якоре, что приводит к снижению момента инерции машины. Поэтому для нормальной работы машины необходимо поддерживать постоянную скорость вращения якоря.
